

CLDV6212 POE Part 1 Brief

The ABC Retail web app will be built along the following lines:

- 1) There will be a minimum of 3 entities/models (Customer, Product, Order) You are welcome to include more if you feel it will add value to your solution/site. Ensure that proper foreign keys and site navigation are done
- 2) The Site must be built and customized properly including CSS, validations as well as presentation of data (all the elements from CLDV6111 are to be included as you build on your skills to create more complete sites)
- 3) Product and customer information will be stored in Azure table storage – ensure that each method links to the storage account
- 4) When an order is created (also in Azure table storage) there must also be a message going to queue storage to notify of a new order.
- 5) When products are created, the image must be uploaded through the site and stored in Azure BLOB storage similar to semester 1 Venues. They must also display from the BLOB storage.
- 6) There should be a page/interface to allow document upload to Azure files (this will be the “Dummy Contracts” which assumes customer can sign and upload a credit agreement or similar.
- 7) Please note that features such as log in, user management, inventory control (increasing and/or decreasing quantity) and securing components of the site will be included at a later date.

NB You are welcome to include any and all elements you feel will add to the site but this is what I will be marking against
